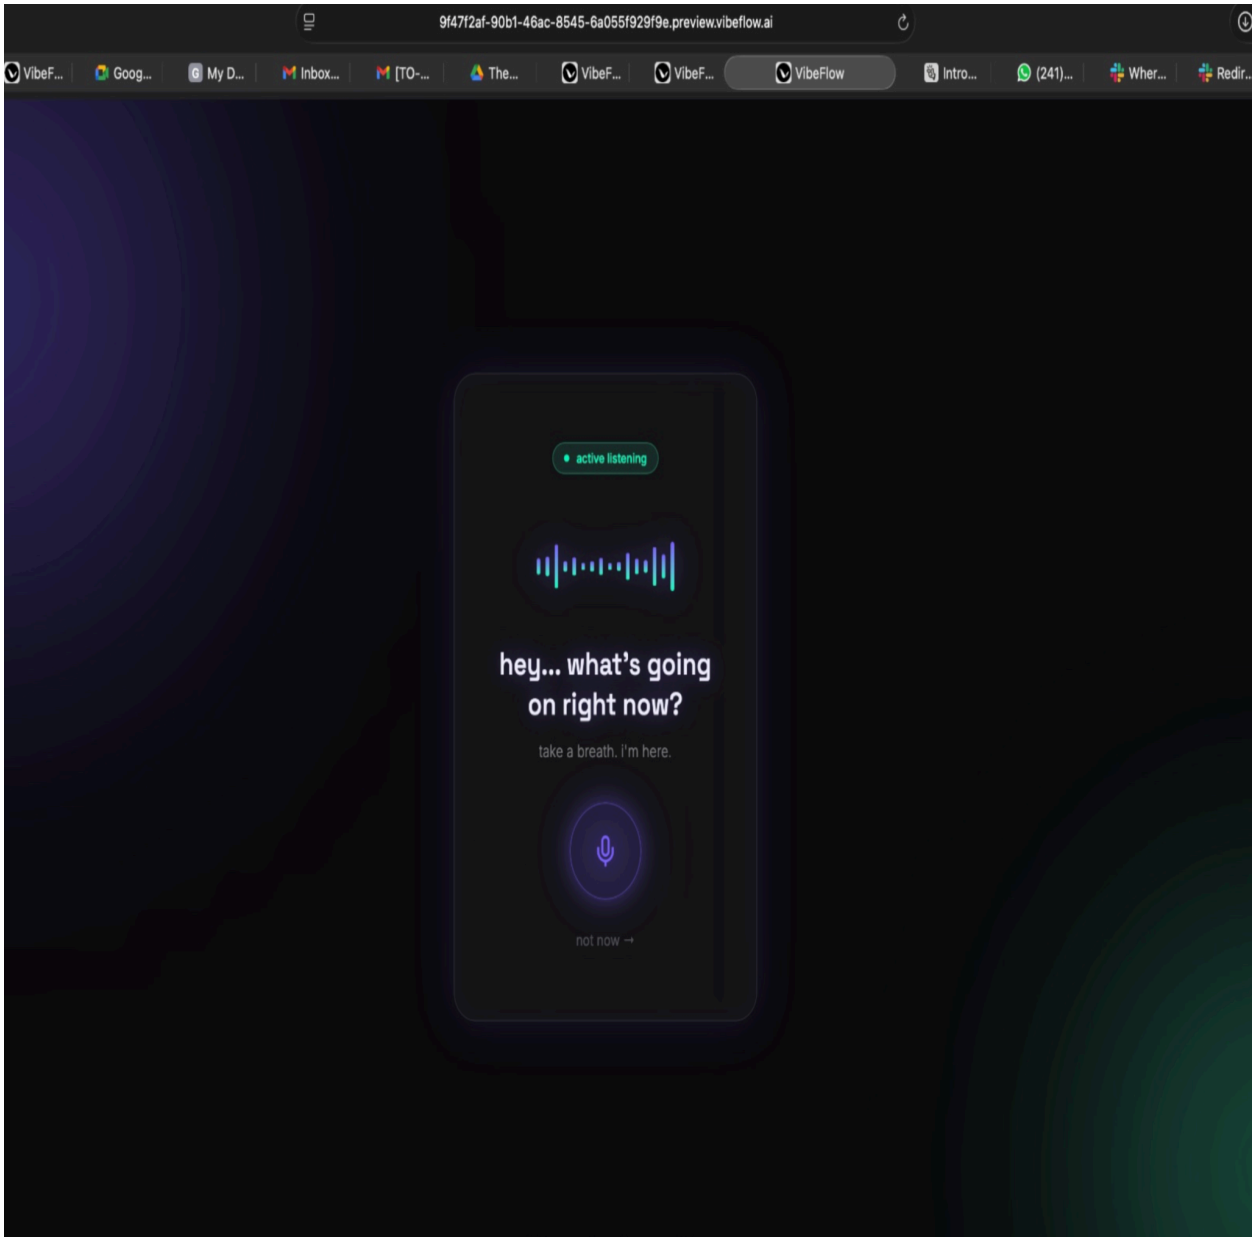
Used Vibeflow for

1. UI for our app Not Ur Mom.
2. Constructed nodes for better version control since both of us teammates are working remotely and from different time zones.



I will read the current `src/index.css` and `src/pages/home.tsx` files to understand the existing codebase before making changes.

Read file `index.css`

Read file `home.tsx`

I will update `src/index.css` to include the Google Fonts import and the required custom keyframe animations.

`index.css +2`

`index.css +30 -4`

I will replace the contents of `src/pages/home.tsx` with the new Interruption Screen implementation, including the layout, animations, glass card, and SVG logo as specified in the plan.

`home.tsx +129`

I will search for "lucide-react" in the `src` directory to confirm its availability. I will also search for "@radix-ui/react-icons" to see if it is used instead.

`lucide-react` (8 matches)

`@radix-ui/react-icons` (23 matches)

I will optimize `src/pages/home.tsx` by using `useMemo` to stabilize the random heights of the waveform bars, preventing unnecessary re-renders.

`home.tsx +6 -1`

`home.tsx +2 -2`

Accessibility & keyboard navigation | Responsive & safe-area optimization
